The Value of Performance

per Google AI (Gemini)

A perfect performance score of 100 offers lowest bounce rates, best user experience, engagement and conversion while improving long-term page rank.

A well-optimized 0.145MB page may climb several positions (eg., from #10 to #3) over a 3.7 MB competitor with identical content.

Page speed of 500ms versus 2,600ms significantly improves user engagement and conversion rates benefitting page rank.

Moving up just one position in SEO's top 10 can increase click-through rates (CTR) by 30.8%.

Every 100ms of delay decreases conversion rates by up to 7%. A 500ms delay causes a 26% increase in frustration and 8% decrease in engagement.
